## License Agreement

Permission is hereby granted by the Open Geospatial Consortium, ("Licensor"), free of charge and subject to the terms set forth below, to any person obtaining a copy of this Intellectual Property and any associated documentation, to deal in the Intellectual Property without restriction (except as set forth below), including without limitation the rights to implement, use, copy, modify, merge, publish, distribute, and/or sublicense copies of the Intellectual Property, and to permit persons to whom the Intellectual Property is furnished to do so, provided that all copyright notices on the intellectual property are retained intact and that each person to whom the Intellectual Property is furnished agrees to the terms of this Agreement.

If you modify the Intellectual Property, all copies of the modified Intellectual Property must include, in addition to the above copyright notice, a notice that the Intellectual Property includes modifications that have not been approved or adopted by LICENSOR.

THIS LICENSE IS A COPYRIGHT LICENSE ONLY, AND DOES NOT CONVEY ANY RIGHTS UNDER ANY PATENTS THAT MAY BE IN FORCE ANYWHERE IN THE WORLD.

THE INTELLECTUAL PROPERTY IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NONINFRINGEMENT OF THIRD PARTY RIGHTS. THE COPYRIGHT HOLDER OR HOLDERS INCLUDED IN THIS NOTICE DO NOT WARRANT THAT THE FUNCTIONS CONTAINED IN THE INTELLECTUAL PROPERTY WILL MEET YOUR REQUIREMENTS OR THAT THE OPERATION OF THE INTELLECTUAL PROPERTY WILL BE UNINTERRUPTED OR ERROR FREE. ANY USE OF THE INTELLECTUAL PROPERTY SHALL BE MADE ENTIRELY AT THE USER'S OWN RISK. IN NO EVENT SHALL THE COPYRIGHT HOLDER OR ANY CONTRIBUTOR OF INTELLECTUAL PROPERTY RIGHTS TO THE INTELLECTUAL PROPERTY BE LIABLE FOR ANY CLAIM, OR ANY DIRECT, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER RESULTING FROM ANY ALLEGED INFRINGEMENT OR ANY LOSS OF USE, DATA OR PROFITS, WHETHER IN AN ACTION OF CONTRACT, NEGLIGENCE OR UNDER ANY OTHER LEGAL THEORY, ARISING OUT OF OR IN CONNECTION WITH THE IMPLEMENTATION, USE, COMMERCIALIZATION OR PERFORMANCE OF THIS INTELLECTUAL PROPERTY.

This license is effective until terminated. You may terminate it at any time by destroying the Intellectual Property together with all copies in any form. The license will also terminate if you fail to comply with any term or condition of this Agreement. Except as provided in the following sentence, no such termination of this license shall require the termination of any third party end-user sublicense to the Intellectual Property which is in force as of the date of notice of such termination. In addition, should the Intellectual Property, or the operation of the Intellectual Property, infringe, or in LICENSOR's sole opinion be likely to infringe, any patent, copyright, trademark or other right of a third party, you agree that LICENSOR, in its sole discretion, may terminate this license without any compensation or liability to you, your licensees or any other party. You agree upon termination of any kind to destroy or cause to be destroyed the Intellectual Property together with all copies in any form, whether held by you or by any third party.

Except as contained in this notice, the name of LICENSOR or of any other holder of a copyright in all or part of the Intellectual Property shall not be used in advertising or otherwise to promote the sale, use or other dealings in this Intellectual Property without prior written authorization of LICENSOR or such copyright holder. LICENSOR is and shall at all times be the sole entity that may authorize you or any third party to use certification marks, trademarks or other special designations to indicate compliance with any LICENSOR standards or specifications.

This Agreement is governed by the laws of the Commonwealth of Massachusetts. The application to this Agreement of the United Nations Convention on Contracts for the International Sale of Goods is hereby expressly excluded. In the event any provision of this Agreement shall be deemed unenforceable, void or invalid, such provision shall be modified so as to make it valid and enforceable, and as so modified the entire Agreement shall remain in full force and effect. No decision, action or inaction by LICENSOR shall be construed to be a waiver of any rights or remedies available to it.

None of the Intellectual Property or underlying information or technology may be downloaded or otherwise exported or reexported in violation of U.S. export laws and regulations. In addition, you are responsible for complying with any local laws in your jurisdiction which may impact your right to import, export or use the Intellectual Property, and you represent that you have complied with any regulations or registration procedures required by applicable law to make this license enforceable

## i. Preface

This OGC Implementation Standard defines a Geography Markup Language (GML) version 3.1.1 application schema for describing Earth Observation products (EO products) within the HMA (Heterogeneous EO Missions Accessibility) Application Profile for the OGC™ Catalogue Services Standard v2.0.0 (with Corrigendum) [OGC 04-021r3]

Suggested additions, changes, and comments on this draft report are welcome and encouraged. Such suggestions may be submitted by email message.

## ii. Document terms and definitions

This document uses the specification terms defined in Subclause 5.3 of [OGC 05-008]. In particular, the word “shall” (not “must”) is the verb form used to indicate a requirement to be strictly followed to conform to this standard.

## iii. Submitting organizations

This application schema is being submitted to the OGC by the following organizations:

- **ESA – European Space Agency**
- **CNES – French Space Agency**
- **EUSC**
- **Spacebel s.a.**
- **Spot Image**

The editors would like to acknowledge that this work is the result of collaboration and review of many organizations and would like to thank for the comments and contributions from:

- **ASI**
- **Conterra**
- **DLR**

- **Eumetsat**
- **MDA**

Note : this does not imply a complete endorsement from these organizations).

#### **iv. Document contributor contact points**

All questions regarding this submission should be directed to the editor or the submitters:

				RIDS DAIL-RD-EDT-EN-0003: Add the following elements: o wrsLongitudeGrid o wrsLatitudeGrid
21 july 2008	0.9.3 06- 080r4	Jerome Gasperi	N/A	Update document regarding version 1.2.1 of the XML schema  Correct a schema issue for elements wrsLongitudeGrid and wrsLatitudeGrid  RIDS DAIL-RD-EDT-EN-0005: Add ‘statusDetail’ element. Update ‘status’ element.
Jan 16 2010	1.0	Carl Reed Jerome Gasperi	Various	Preparation for publication as an OGC standard. Corrects inconsistency between this document and the corresponding schema

## vi. Changes to OGC Standards

The existing OGC™ standards do not need any changes to accommodate the technical contents of this standard.

## vii. Future work

This profile is designed to be used mainly in the cataloguing of EO metadata, using the CS-W ebRIM application profile. This standard (07-006) is based on OGC Filter Encoding Standard that uses GML 3.1.1. For consistency, this profile also uses GML 3.1.1.

Future work on this profile will include harmonization with GML 3.x.x, most likely version 3.3.0.

## Foreword

This OGC standard specifies a Geographic Markup Language (GML) version 3.1.1 application schema [OGC 03-105r1 and 04-092r4]. The schema is a GML application schema as specified in Subclause 23 of [OGC 03-105r1].

*Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The Open Geospatial Consortium Inc. shall not be held responsible for identifying any or all such patent rights.*

*Recipients of this document are requested to submit, with their comments, notification of any relevant patent claims or other intellectual property rights of which they may be aware that might be infringed by any implementation of the standard set forth in this document, and to provide supporting documentation.*

## Introduction

The OGC Geography Markup Language is an XML grammar written in XML Schema for the modelling, transport, and storage of geographic information.

From the GML standard, “GML provides a variety of kinds of objects for describing geography including features, coordinate reference systems, geometry, topology, time, units of measure and generalized values. A geographic feature is an abstraction of a real world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth”.

EO data product collections are usually structured to contain data items derived from a sensor onboard a satellite or series of sensors. The key characteristics differentiating these products are date of acquisition, location and in some cases, such as the optical imagery, the possible presence of cloud, haze, smokes or other atmospheric or on ground phenomena obscuring the image. These are the key characteristics; there are however other metadata that are required to identify products of interest.

From a user point of view, an EO data product can be naturally described with a spatial extension (e.g. the geographic footprint of a satellite acquisition) and several attributes describing the metadata (e.g. date of acquisition, etc.). Indeed this point of view is consistent with a GML representation of the data.

The intent of this standard is to describe as a GML version 3.1.1 application schema that can be used with service interfaces for EO data product that can be supported by many data providers (satellite operators, data distributors ...). The metadata described is that which is commonly provided through catalogue interfaces, it does not necessarily include all of the metadata that is present in the actual EO data product (e.g. calibration coefficients etc.).

This standard defines the schemas for generic and thematic EO products (i.e optical, radar and atmospheric missions). In addition, this document describes the mechanism used to extend these schemas to very specific mission such as the French Pleiades mission.

# GML Application Schema for EO Products

## 1 Scope

This application schema document describes the encodings required to describe Earth Observation (EO) products from general to mission specific characteristics.

## 2 Compliance

This document specifies three compliance levels :

- The general level, or “eop” level, describes the general EO Products schema;
- The thematic level extends the “eop” level to describes thematic EO Products such as optical, radar or atmospheric products (respectively “opt”, “sar”, “atm” levels);
- The mission specific level extends one of the “thematic” level to describes mission specific EO Products. For instance the French Pleiades mission uses the “phr” level which extends the “opt” thematic level.

EO Products data encoded using this application schema shall produce XML documents that are fully compliant with normative XML Schema Documents associated with this standard(i.e. *eop.xsd* for general EO Products, *opt.xsd*, *sar.xsd* and *atm.xsd* for optical, radar and atmospheric products respectively).

More specifically, compliance with this standard shall be checked using all the relevant tests specified in Annex A (normative).

## 3 Normative references

The following normative documents contain provisions that, through reference in this text, constitute provisions of this document. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. For undated references, the latest edition of the normative document referred to applies.

OGC 03-105r1, *OpenGIS Geography Markup Language (GML) Implementation Standard*, Version 3.1.0,

OGC 04-092r4, *GML 3.1.1 schemas*

OGC 05-008, *OGC Web Services Common Standard*, Version 1.0.0

OGC 05-010, *URNs of definitions in ogc namespace* (Recommendation Paper), Version 1.0.0

W3C, *Extensible Markup Language (XML) 1.0* (Second Edition), W3C Recommendation, 6 October 2000, <http://www.w3.org/TR/REC-xml>

W3C, *XML Schema Part 1: Structures*, <http://www.w3.org/TR/xmlschema-1>

W3C, *XML Schema Part 2: Datatypes*, <http://www.w3.org/TR/xmlschema-2>

W3C, *Namespaces in XML*, <http://www.w3.org/TR/1999/REC-xml-names-19990114>

In addition to this document, this standard includes several normative XML Schema files. Following approval of this document, these schemas will be posted online at the <http://schemas.opengis.net>. These XML Schema files are also bundled with the present document. In the event of a discrepancy between the bundled and online versions of the XML Schema files, the online files shall be considered authoritative.

## 4 Terms and definitions

For the purposes of this standard, the definitions specified in Clause 4 of the OWS Common Implementation Standard [OGC 05-008] shall apply. In addition, the following terms and definitions apply.

**client**

software component that can invoke an **operation** from a **server**

**datastrip**

A satellite acquisition

**geographic information**

information concerning phenomena implicitly or explicitly associated with a location relative to the Earth [ISO 19128 draft]

**identifier**

a character string that may be composed of numbers and characters that is exchanged between the client and the server with respect to a specific identity of a resource

**qualified name**

name that is prefixed with its naming context

EXAMPLE      The qualified name for the road no attribute in class Road defined in the Roadmap schema is RoadMap.Road.road\_no. [ISO 19118].

**request**

invocation of an **operation** by a **client**

**response**

result of an **operation**, returned from a **server** to a **client**

**scene**

The cutting of a datastrip into part. For PHR mission, a scene is a 20x20 km<sup>2</sup> square part.

**schema**

formal description of a model [ISO 19101, ISO 19103, ISO 19109, ISO 19118]

## 5 Conventions

### 5.1 Abbreviated terms

The abbreviated terms used in this document include:

ATM Atmospheric

EO Earth Observation

EOP Earth Observation Product

GML Geography Markup Language

HMA Heterogeneous Mission Accessibility

OGC Open Geospatial Consortium

PHR Pleiades High Resolution

OPT OPTical

SAR Synthetic Aperture Radar

XML eXtensible Markup Language

### 5.2 Namespace prefix conventions

The namespace prefixes used in this document are **not** normative and are merely chosen for convenience; they may appear in examples without being formally declared, and have no semantic significance. The namespaces to which the prefixes correspond are normative, however.

Prefix	Namespace URI	Description
--------	---------------	-------------

eop	<a href="http://earth.esa.int/eop">http://earth.esa.int/eop</a>	General EO product schema namespace
opt	<a href="http://earth.esa.int/opt">http://earth.esa.int/opt</a>	Optical High Resolution EO product schema namespace
sar	<a href="http://earth.esa.int/sar">http://earth.esa.int/sar</a>	Radar EO product schema namespace
atm	<a href="http://earth.esa.int/atm">http://earth.esa.int/atm</a>	Atmospheric EO product schema namespace
phr	<a href="http://eop.cnes.fr/phr">http://eop.cnes.fr/phr</a>	Pleiades High Resolution product schema namespace

**Table 1 : namespace mappings**

## 6 Overview

This section focuses on the purpose and requirements for this standard. In particular, the document describes the context of use of the EO Product application schema.

### 6.1 General concepts

The approach consists in modelling EO data product through a GML application schema. ISO definitions are specified for attributes where available, although not the full ISO schema is used for the structural definitions, which would lead to a less efficient overall structure.

The general mechanism is to create a schema with a dedicated namespace for each level of specificity from a general description which is common to each EO Product to a restricted description for specific mission EO Product. Each level of specificity is an extension of the previous one.

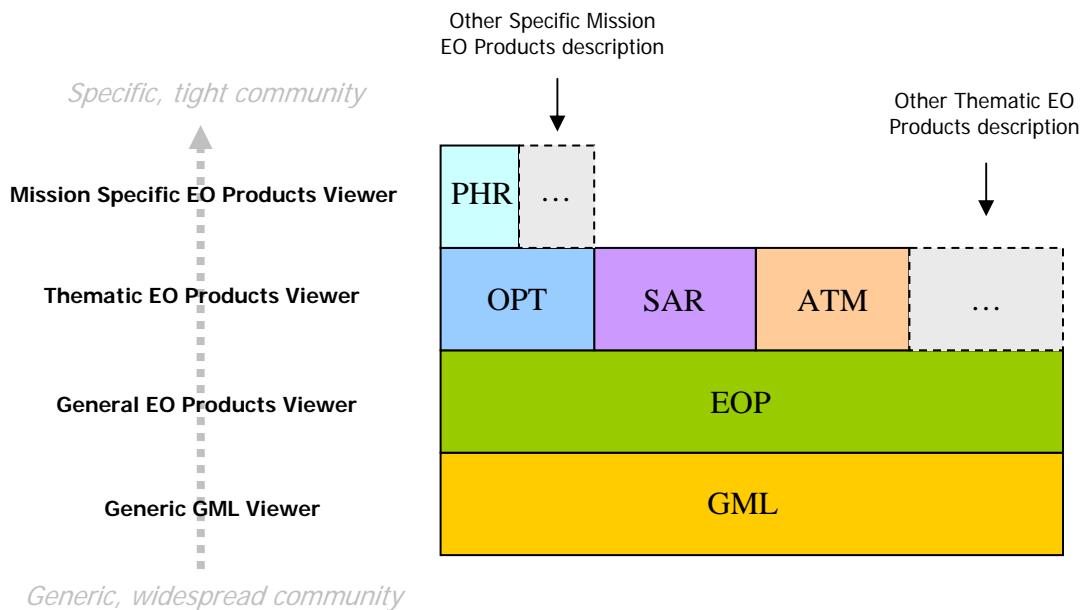

The General EO product schema is the main application schema for EO Product data. It is associated with the “eop” namespace.

Each Thematic EO product schemas extends the “eop” schema :

- The Optical EO Product schema is used to describe optical products. It is associated with the “opt” namespace;
- The SAR EO Product schema is used to describe radar products. It is associated with the “sar” namespace;
- The Atmospheric EO Product schema is used to describe atmospheric products. It is associated with the “atm” namespace;

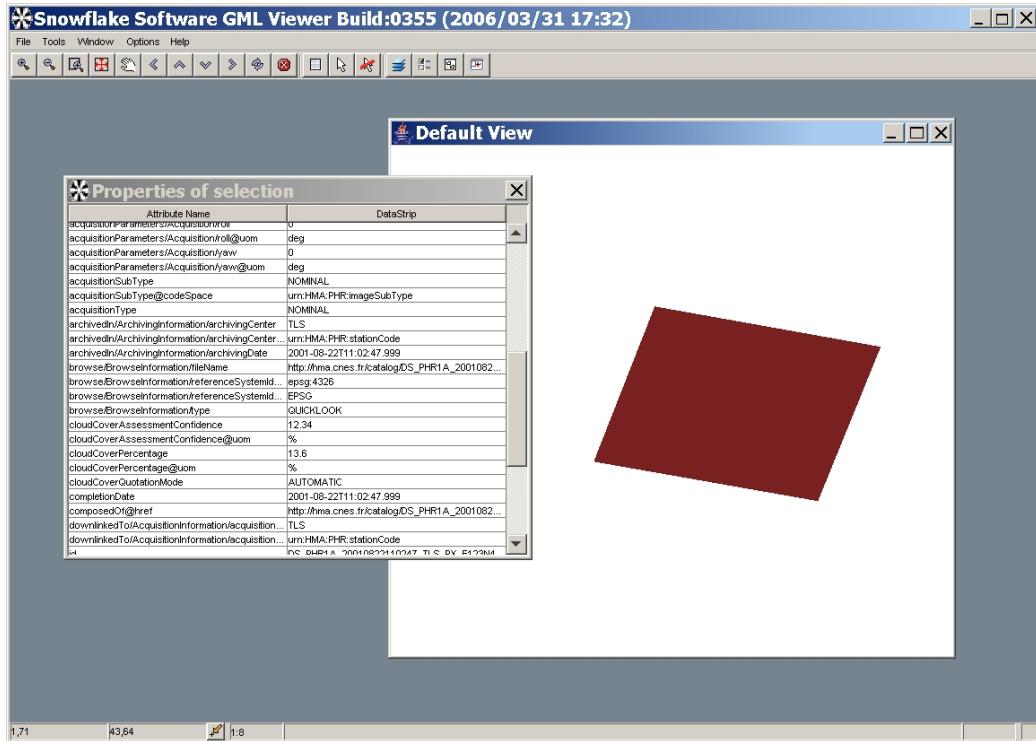

The idea behind this set of layered levels approach, is

- 1) to create an efficient schema set that describes EO Product metadata concentrating on the core metadata that key characteristics differentiate a products within a collection.
- 2) to profit by the widespread use of GML so that our products can be displayed by a large variety of GML viewer from generic one, which will see EO Products as features with footprint and “unknown” metadata, to EO Product specific one, which will understand the semantic of these metadata (cf. Figure 1)

**Figure 1 : A layered view of GML EO Products data..**

More precisely, a generic GML viewer will only understand the “gml” vocabulary of the GML document; a “Generic EO Products viewer” will understand the “gml” and “eop” vocabulary of the GML document; an “Optical EO Products viewer” will understand the “gml”, “eop” and “opt” vocabulary of the GML document. The “phr” vocabulary will only be understood by a “Specific PHR Viewer” that extends the “Optical EO Products Viewer”.

**Figure 2 : A generic GML viewer understand the “gml” vocabulary and thus displays the product footprint (gml:multiExtentOf property). With no semantic knowledge on the EO product schema, the reader is able to displays the related attributes in an xpath/value fashion**

## 6.2 GML Observation

An Observation in GML models the act of observing or measuring some quantity. The quantity to be measured can be simple (a single temperature), or it may be a complex quantity such as a coverage<sup>1</sup>. Remotely sensed images in the sense of their acquisition can be viewed as observations in which the result of the observation (value of the resultOf property) is a remotely-sensed image product.

The structure of a GML observation is as follows :

- metadataProperty – general metadata describing the observation ;
- validTime - when the observing took place ;
- using - the mechanism (procedure, instrument etc.) used in the observing ;
- target - the entity that is the subject or target of the observation ;
- resultOf - what resulted from the observing.

---

<sup>1</sup> ”A coverage is a subtype of feature that has a coverage function with a spatiotemporal domain and a value set range of homogeneous 1- to n- dimensional tuples”(OGC 04-092r4)

### 6.2.1 Earth Observation mapping on *gml:Observation*

The Earth Observation is modelled to fit exactly the *gml:Observation* structure and always has the same first level structure (i.e. *gml:using*, *gml:target*, etc.).

Thus, the eop namespace contains:

- eop "words" (i.e. technically speaking global element declaration) : *identifier*, *status*, *dowlinkedTo*, etc. These words are referenced inside higher level structure (or "blocks", see Table 2)
- an *eop:EarthObservation* element that inherits from *gml:Observation*. This inheritance is an XML schema extension (to avoid restriction problems) with no element added (because all elements fit inside one of the *gml:Observation* property *metaProperty*, *validTime*, *using*, *target* or *resultOf*)

The content of *gml:Observation* properties is as follows :

Property	Description within Earth Observation context	Awaited Content
<i>metaProperty</i>	Describe general properties such as the data identifier, the downlink and archiving information	<i>eop:EarthObservationMetadata</i>
<i>validTime</i>	Describe the acquisition duration, i.e. the start and end date of acquisition	<i>gml:TimePeriod/gml:beginPosition</i> <i>gml:TimePeriod/gml:endPosition</i>
<i>using</i>	Describe the Platform/Instrument/Sensor used for the acquisition and the acquisition parameters (i.e. pointing angles, etc.)	<i>eop:EarthObservationEquipment</i>
<i>target</i>	Describe the observed area on ground i.e. the footprint of acquisition	<i>eop:Footprint</i>
<i>resultOf</i>	Describe the Earth Observation result composed of the browse, mask and product description	<i>eop:EarthObservationResult</i>

**Table 2: *gml:Observation* properties mapping within Earth Observation context**

The elements *eop:EarthObservationMetadata*, *eop:EarthObservationInstrument*, *eop:Footprint* and *eop:EarthObservationResult* are described in §7.

### 6.3 General rules

We defined the following rules for creating the application schemas.

### 6.3.1 Language rules

Natural language used as far as possible for property names. For instance, complete names for properties are preferred to abbreviations.

Property name “composedOf” is used to define structural links to extended metadata. For instance a “phr:Datastrip” is logically splitted into one or more ”phr:Scene”. Thus, each Scene in the “phr:Datastrip” schema is referenced with the “eop:composedOf” property.

Property name “subsetOf” is used to define structural links to “father” metadata. For instance in the previous example, the “phr:Datastrip” is referenced within the “phr:Scene” by the “eop:subsetOf” property name.

### 6.3.2 Extensions rules

As see in §6.2.1, we want each Earth Observation product to fit exactly the structure of a *gml:Observation* element.

Thus, in the inheritance mechanism for thematic or mission specific namespaces, we need to extends existing properties defined in eop or create new property that fit inside the model.

#### 6.3.2.1 Thematic extended namespace

Thematic extended namespace (opt for example) contains :

- opt "words";
- an *opt:EarthObservation* element that inherits from *eop:EarthObservation*. This inheritance is an XML schema extension (to avoid restriction problems) with no element added (because all elements fit inside one of the Observation property *metaDataProperty*, *validTime*, *using*, *target* or *resultOf*);
- one or more extension of existing eop properties (see example below).

For example, “opt” thematic EO Products metadata include the solar azimuth angle, named “illuminationAzimuthAngle”. This property is described within *opt:Acquisition* element which extends and acts as a substitution for *eop:Acquisition* :

```
<opt:EarthObservation>
  [...]
  <gml:using>
    <eop:EarthObservationEquipment>
      [...]
      <eop:acquisitionParameters>
        <opt:Acquisition>
          [...]
          <eop:orbitDirection>ASCENDING</eop:orbitDirection>
          [...]
          <opt:illuminationAzimuthAngle>56,67</opt:illuminationAzimuthAngle>
        </opt:Acquisition>
      </eop:acquisitionParameters>
```

```

[...]
</eop:EarthObservationEquipment>
</gml:using>
[...]
</opt: EarthObservation>
```

### 6.3.2.2 Mission specific extended namespace

Mission specific extended namespace (phr for example) contains :

- phr "words";
- a *phr:EarthObservation* element that inherits from *opt:EarthObservation*. This inheritance is an XML schema extension (to avoid restriction problems) with no element added (because all elements fit inside one of the Observation property *metaDataProperty*, *validTime*, *using*, *target* or *resultOf*);
- one or more extension of existing opt properties (e.g. in phr, an extension of *opt:EarthObservationResult* to add *cloudCoverPercentageConfidenceIndex*).

These rules are closed to those described in the thematic extended namespace. However, the property extension approach leads to a drawback in the mission specific case.

Indeed, from a client point of view, an “eop” enabled reader must encounter well-known structures under a “eop” properties. This may not be a problem for “eop” and thematics schemas since they are completely described in this document (i.e. structure can be “hard coded”).

However, a mission specific schema shall follow the rules described in this document but the content of this schema is not in the scope of this document. Thus a generic “eop” enabled reader shall be able to process complex schema inheritance mechanisms to “understand” mission specific data.

To avoid this drawback, we introduce an attribute "*eop:type*" at the eop level. This attribute is required for properties that extends one of eop or thematic property. This attribute is expected to contain the name of the property it extends directly. This mechanism is comparable to the ISO19139 *gco:isoType*.

For example for a *phr:DataStrip* that extends *opt:EarthObservation* :

```

<phr:DataStrip eop:type="opt:EarthObservation">
[...]
<gml:resultOf>
  <phr:EarthObservationResult eop:type="opt:EarthObservationResult">
    <eop:browse>
    <eop:product>
    <eop:mask>
      <opt:cloudCoverPercentage uom='%'>30</opt:cloudCoverPercentage>
      <phr:cloudCoverAssessmentConfidence uom='%'>10</phr:cloudCoverAssessmentConfidence>
    </phr:EarthObservationResult>
  </gml:resultOf>
[...]
```

</phr:DataStrip>

### 6.3.3 Use of Schematron

The *gml:Observation* properties have a very generic definition that do not offer sufficient content constraints within XML Schema, e.g. :

- *using* : any gml Feature;
- *target* : any gml Feature or Geometry;
- *resultOf* : any gml Object.

This leads to an Earth Observation model with properties that cannot be tightly validated with the XML schema mechanism.

To clarify, let's take an example. The *eop:EarthObservationEquipement* feature shall be used under the "*gml:using*" property. Nevertheless, the following documents would perfectly validate:

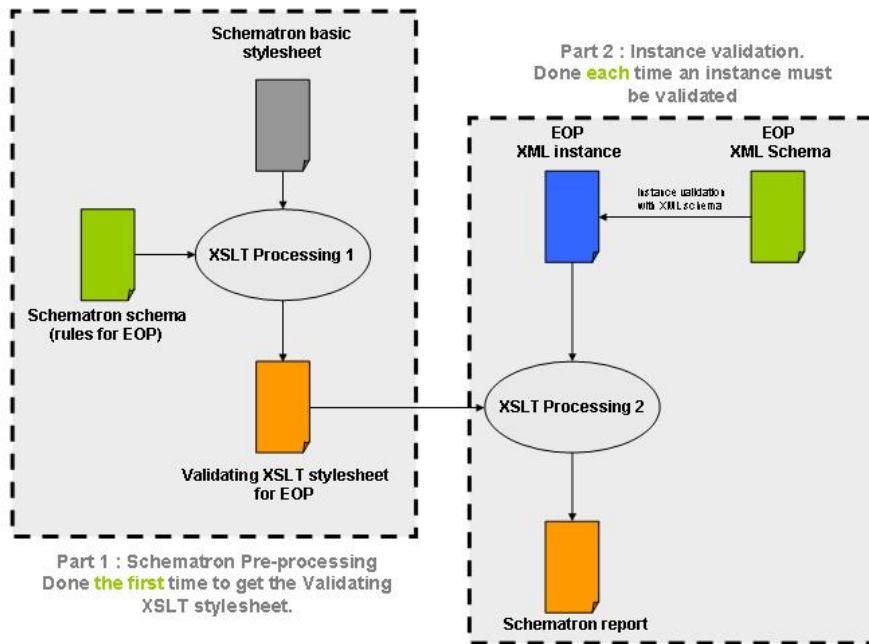

- a *gml:Observation* with any other feature that a *EarthObservationEquipement* under the "*using*" property;
- a *gml:Observation* with a "*EarthObservationEquipement*" under the "*resultOf*" property (since a gml feature inherits from gml object).

A proposed solution to have tightly validated Earth Observation products is to complement XML schema with the use of Schematron.

#### 6.3.3.1 Schematron basics

Schematron is a rule-based language that uses XPath to express assertions about the content in an XML instance document. This can be done by transforming the Schematron schema with a base stylesheet, which turns the schema into an XSLT stylesheet. The stylesheet checks the assertions defined by running the XML instance document through an XSLT processor. The result of the transformation is a report, in XML format, that contains details on which assertions failed along with the comments provided with that particular rule in the schema.

Applied to the Earth Observation products case, this can be summarized in Figure 3.

**Figure 3 : schematron processing for Earth Observation products**

The "Part 1 : pre-processing" step is needed to get the validating stylesheet for EOP. It is processed from :

- the schematron basic stylesheet (aka "skeleton stylesheet") from <http://www.schematron.com> slightly modified for eop (i.e. add eop namespaces into the skeleton : *schematron\_skeleton\_for\_eop.xsl*;
- the schematron schema rules for eop : *schematron\_rules\_for\_eop.sch*;
- an XSLT processor.

We used XMLSpy 2004 as the XSLT processor to generate the validating stylesheet *schematron\_result\_for\_eop.xsl*

This processing is done only one time. This stylesheet will then be used each time we need to validate an EOP XML instance : first an EOP XML instance is validated syntactically and semantically by the EOP XML schema; second it is validated against the validating stylesheet. The schematron report indicates if error where found.

### 6.3.3.2 Schematron rules for eop

The following rules were defined at the eop level :

- *gml:metadataProperty* must contains an *eop:EarthObservationMetadata*;
- *gml:validTime* must contains a *gml:TimePeriod/gml:beginPosition* and *gml:TimePeriod/gml:endPosition* ;
- *gml:using* must contains an *eop:EarthObservationEquipement* ;
- *gml:target* must contains an *eop:Footprint* ;
- *gml:multiExtentOf* must contains a  
*gml:MultiSurface/gml:surfaceMembers/gml:Polygon/gml:exterior/gml:LinearRing/gml:posList* ;
- *gml:resultOf* must contains an *eop:EarthObservationResult*.

More generally, the schematron rules for extension in the general case can be summarized as follow:

- if root element is *eop:EarthObservation* then the whole property are in the *eop* namespace ;
- if root element is *opt:EarthObservation* then the whole property are in the *eop* namespace or in the *opt* namespace ;
- if root element is *sar:EarthObservation* then the whole property are in the *eop* namespace or in the *sar* namespace ;
- if root element is *atm:EarthObservation* then the whole property are in the *eop* namespace or in the *atm* namespace ;
- if root element is *xxx:EarthObservation*, where *xxx* is a specific mission namespace, then the whole property are in the *eop* namespace or in the thematic namespace extended by *xxx* (i.e. *opt*, *sar* or *atm*) or must be defined with a *eop:type* attribute containing explicitly the property it extends directly

### 6.3.4 CodeList

Property that shall be described within a given codeSpace shall use the *<eop:CodeWithAuthorityType>*. Note that this type will be replaced by the incoming *<gml:CodeWithAuthorityType>* (shall be available in GML 3.2).

```

<xs:complexType name="CodeWithAuthorityType">
  <xs:annotation>
    <xs:documentation>From GML 3.2 draft</xs:documentation>
  </xs:annotation>
  <xs:simpleContent>
    <xs:extension base="xs:string">

```

```

<xs:attribute name="codeSpace" type="xs:anyURI" use="required"/>
</xs:extension>
</xs:simpleContent>
</xs:complexType>

```

Example : to guarantee the uniqueness of the EarthObservationProduct identifier within EOP, the <eop:identifier> includes the ground segment namespace through the codeSpace attribute.

```

<eop:identifier
codeSpace="urn:EOP:PHR:catalog:TLS:id">DS_PHR1A_20010822110247_TLS_PX_E123N45_0101_0123
4</eop:identifier>

```

### 6.3.5 Units of measure

Each non-angle property concerned by a unit of measure shall use the existing GML type <gml:MeasureType>.

Example : image resolution

```

<xs:element name="resolution" type="gml:MeasureType">
<xs:annotation>
    <xs:documentation>Image resolution</xs:documentation>
</xs:annotation>
</xs:element>

```

Each angle property shall use the existing GML type <gml:AngleType>.

Example : Across Track incidence angle

```

<xs:element name="acrossTrackIncidenceAngle" type="gml:AngleType" minOccurs="0">
<xs:annotation>
    <xs:documentation>Across Track Incidence angle given in degrees.</xs:documentation>
</xs:annotation>
</xs:element>

```

### 6.3.6 Use of xlink

Properties that shall only describe an urn shall use the <eop:HrefPropertyType>. This complex type is a restriction of <gml:Feature.PropertyType> that only includes the “xlink” attribute.

```

<xs:complexType name="HrefPropertyType">
<xs:complexContent>
    <xs:restriction base="gml:FeaturePropertyType">
        <xs:sequence/>
        <xs:attribute ref="xlink:href" use="required"/>
    </xs:restriction>
</xs:complexContent>
</xs:complexType>

```

Properties that shall describe either an urn or the content of that urn shall use an extension of <gml:AbstractFeatureType>.

Example : “composedOf” property reference either the urn (xlink attribute) or the GML content of an EarthObservationProduct.

Thus in <eop:EarthObservation> the element “composedOf” is defined as an <eop:EarthObservation> which extend <gml:AbstractFeatureType>.

```
<xs:element name="composedOf" type="eop:EarthObservationPropertyType"/>
<xs:complexType name="EarthObservationPropertyType">
  <xs:sequence>
    <xs:element ref="eop:EarthObservation" minOccurs="0"/>
  </xs:sequence>
  <xs:attributeGroup ref="gml:AssociationAttributeGroup"/>
</xs:complexType>
```

### 6.3.7 GML restrictive use

We restricted the use of GML types to those relevant to the EO Products metadata description, i.e. :

- gml:Observation ;
- gml:Feature ;
- gml:AngleType ;
- gml:CodeListType ;
- gml:MeasureType ;
- gml:centerOf (expected structure : gml:Point/gml:pos) ;
- gml:multiExtentOf (expected structure :  
gml:MultiSurface/gml:surfaceMembers/gml:Polygon/gml:exterior/gml:LinearRing/gml:posList)

See chapter 7.3 for discussion about this restrictive use of GML.

## 7 EO Products application schemas

### 7.1 General EO product data schema

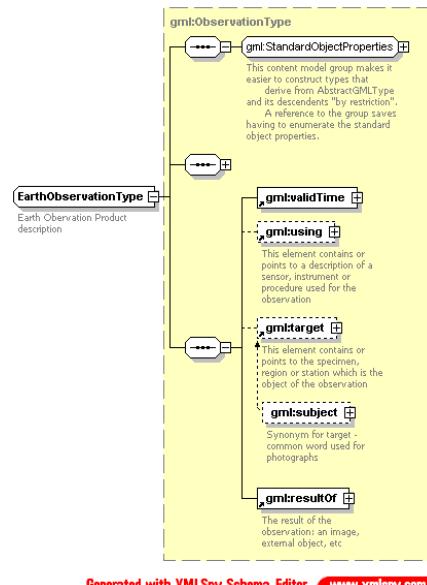

The “eop” schema provides the description of metadata common to all EO Products derived from satellite based remote sensing.

The root element of the “eop” schema, named <eop:EarthObservation> extends the <gml:ObservationType> type as follows :

```

<xs:element name="EarthObservation" type="eop:EarthObservationType"
substitutionGroup="gml:Observation"></xs:element>
  <xs:complexType name="EarthObservationType">
    <xs:complexContent>
      <xs:extension base="gml:ObservationType">
        <xs:attribute name="version" type="xs:string" use="required" fixed="1.2">
          <xs:annotation>
            <xs:documentation>Reference to the schema version number used to validate the
instance</xs:documentation>
          </xs:annotation>
        <xs:attribute>
        </xs:extension>
      </xs:complexContent>
    </xs:complexType>
  </xs:element>

```

**Figure 4: <eop:EarthObservationType> diagram**

The “EarthObservation” element contains a mandatory “version” attribute that reference the schema version number. This should be used by instance parser to know which version of the eop schema validate the instance

The “eop” metadata are referenced inside higher level structure (see Table 2) :

- *eop:EarthObservationMetadata;*
- *eop:EarthObservationEquipment;*
- *eop:Footprint;*
- *eop:EarthObservationResult;*

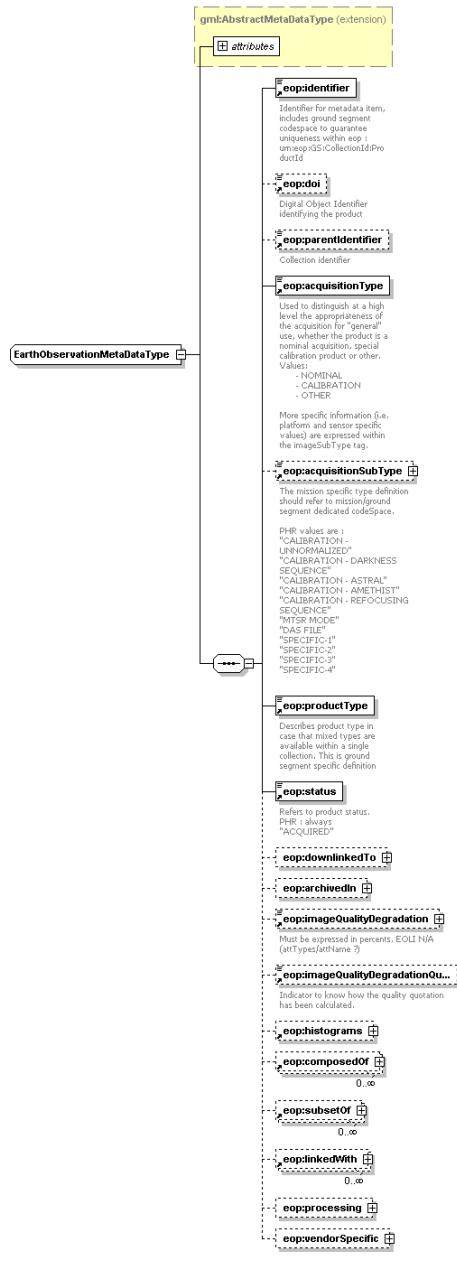

Complete description of an *EarthObservation* element is given in Table 3.

<b>Field name</b>	<b>Field description</b>	<b>ISO 19115-2 definition</b>	<b>ISO mapping</b>	<b>Cardinality</b>
gml:validTime/ gml:TimePeriod/ gml:beginPosition	Acquisition start date time dateTime in ISO 8601 format (CCYY-MM- DDThh:mm[:ss[.cc]]Z)	MI_AcquisitionInformation/ MI_MissionIdentification/ startDate	no	1
gml:validTime/ gml:TimePeriod/ gml:endPosition	Acquisition end date time dateTime in ISO 8601 format (CCYY-MM- DDThh:mm[:ss[.cc]]Z)	MI_AcquisitionInformation/ MI_MissionIdentification/ completionDate	no	1
gml:using/ eop:EarthObservationEquipment	Platform/Instrument/S ensor used for the acquisition and the acquisition parameters (i.e. pointing angles, etc.)		no	0..1
gml:target/ eop:Footprint	Observed area on ground i.e. the footprint of acquisition		no	0..1
gml:resultOf/ eop:EarthObservationResult	Earth Observation result composed of the browse, mask and product description		no	0..1

**Table 3 : <eop:EarthObservation> fields description**

### 7.1.1 EarthObservationMetadata

The *eop:EarthObservationMetadata* block contains all the metadata relative to an *eop:EarthObservation* that do not fit inside one of the other blocks, i.e. metadata that don't describe the time, the mechanism, the location or the result of the observation (Figure 5).

Generated by XmlSpy      www.altova.com

Figure 5 : <eop:EarthObservationMetadata> diagram

These metadata are mainly the *EarthObservation* identifier, the acquisition type and information relative to the downlink and archiving centers. Complete description of the *EarthObservationMetadata* is given in Table 4.

Field name	Field description	ISO 19115-2 definition	ISO mapping	Cardinality
identifier	Identifier for metadata item, includes ground segment namespace to guarantee uniqueness within EOP		no	1
doi	Digital Object Identifier identifying the product (see <a href="http://www.doi.org">http://www.doi.org</a> )		no	0..1
parentIdentifier	Collection Identifier		no	0..1
acquisitionType	Used to distinguish at a high level the appropriateness of the acquisition for "general" use, whether the product is a nominal acquisition, special calibration product or other.  Values: - NOMINAL - CALIBRATION - OTHER		no	1
acquisitionSubType	The broad value is however too restrictive, so mission specific type definition should refer to mission/ground segment dedicated codeSpace		no	0..1
productType	Describes product type in case that mixed types are available within a single collection, this is ground segment specific definition	MD_ContentInformation/ MD_CoverageDescription/ MD_CoverageContentType	no	0..1
status	Refers to product status.  Values : - ARCHIVED - ACQUIRED - CANCELLED - FAILED - PLANNED	MD_Identification/ MD_ProgressCode	no	1

	- POTENTIAL - REJECTED			
statusDetail	This field refers to the eop:status value. It should be used to motivate the reason of a failure deletion or rejection		no	0..1
downlinkedTo/ DownlinkInformation/ acquisitionStation	Acquisition / receiving station code. Possible values are mission specific and should be retrieved using codespace.		no	1 (with AcquisitionInformation 0..n)
downlinkedTo/ DownlinkInformation/ acquisitionDate	Acquisition date time.		no	0..1
archivedIn/ ArchivingInformation/ archivingCenter	Archiving center code. Possible values are mission specific and should be retrieved using codeSpace.		no	1 (with ArchivingInformation 0..n)
archivedIn/ ArchivingInformation/ archivingDate	Archiving date time.		no	1
archivedIn/ ArchivingInformation/ archivingIdentifier	Local archiving id as created by the mission ground segment that may required to allow subsequent order processing		no	0..1
imageQualityDegradation	Quality degradation percentage (i.e. uom='%')		no	0..1
imageQualityDegradationQuotationMode	Indicator to know how the quality degradation percentage has been calculated.  Value : AUTOMATIC, MANUAL		no	0..1
histograms/ Histogram/ bandId	Histogram specific : identifier of the spectral band used to compute histogram values		no	0..1 (with Histogram 1..n)
histograms/ Histogram/	Histogram specific : minimum value		no	1

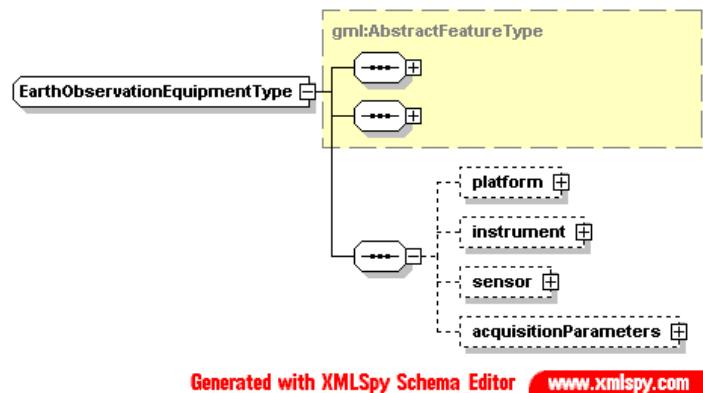

min				
histograms/ Histogram/ max	Histogram specific : maximum value		no	1
histograms/ Histogram/ mean	Histogram specific : mean value		no	0..1
histograms/ Histogram/ stdDeviation	Histogram specific : standard deviation value		no	0..1
composedOf	Link to an EO product that is part of this EO product (e.g. a phr:DataStrip is composed of one or more phr:Scene)		no	0..1
subsetOf	Link to the “father” EO product (e.g. a phr:Scene is a subset of a phr:DataStrip)		no	0..1
linkedWith	Specify a link to another EO product (e.g. ERS1 and ERS2 interferometric pair)		no	0..1
processing/ ProcessingInformation/ processingCenter	Processing center code. Possible values are mission specific and should be retrieved using codeSpace.		no	0..n
processing/ ProcessingInformation/ processingDate	Processing date time		no	0..n
processing/ ProcessingInformation/ compositeType	Composite type of product, if available		no	0..n
processing/ ProcessingInformation/ method	Method used to compute datalayer. (e.g. Kalman filtering, ROSE)		no	0..n
processing/ ProcessingInformation/ methodVersion	Method version (e.g. 1.0)		no	0..n
processing/ ProcessingInformation/ processorName	Processor software name (e.g. FastROSE)		no	0..n
processing/ ProcessingInformation/	Processor software version (e.g. 1.0)		no	0..n

processorVersion				
processing/ ProcessingInformation/ processingLevel	Processing level applied to the product		no	0..n
processing/ ProcessingInformation/ nativeProductFormat	Native product format		no	0..n
vendorSpecific/ SpecificInformation/ localAttribute	Container for ad-hoc metadata that does not merit a mission specific schema or extension, the localAttribute describes the name of the attribute		no	1  (with SpecificInfor mation 0..n)
vendorSpecific/ SpecificInformation/ localValue	Container for ad-hoc metadata that does not merit a mission specific schema or extension, the localAttribute describes the value of the attribute		no	1  (with SpecificInfor mation 0..n)

**Table 4 : <eop:EarthObservationMetadata> fields description**

### 7.1.2 EarthObservationEquipment

The *eop:EarthObservationEquipment* block contains metadata relative to the mechanism used during the *EarthObservation* (Figure 6).

**Figure 6 : <eop:EarthObservationEquipment> diagram**

These metadata describe on one hand the platform, instrument and sensor used for the *Earthobservation*, and, on the other hand, the acquisition parameters of this observation. Complete description of the *EarthObservationEquipment* is given in Table 4.

<b>Field name</b>	<b>Field description</b>	<b>ISO 19115-2 definition</b>	<b>ISO mapping</b>	<b>Cardinality</b>
platform/ Platform/ shortName	Platform short name (e.g. PHR)	MD_DataIdentification/ MI_DataIdentification/ MI_AquisitionInformation/MI_PlatformIdentification/ shortName	yes	1
platform/ Platform/ serialIdentifier	Platform serial identifier (e.g. for PHR : 1A)	MD_DataIdentification/ MI_DataIdentification/ MI_AquisitionInformation/MI_PlatformIdentification/ serialIdentifier	yes	0..1
platform/ Platform/ orbitType	High level characterisation of main mission types (GEO/LEO)		no	0..1
instrument/ Instrument/ shortName	Instrument (Sensor) name	MD_DataIdentification/ MI_DataIdentification/ MI_AquisitionInformation/ MI_PlatformIdentification/ MI_InstrumentIdentification/ shortName	yes	1
sensor/ Sensor/ sensorType	Sensor type. This field should contain an enumeration : - OPTICAL - RADAR - ALTIMETRIC - ATMOSPHERIC	MD_CoverageDescription/ MI_CoverageDescription/ MI_Sensor/ sensorType	yes	0..1
sensor/ Sensor/ operationalMode	Sensor mode. Possible values are mission specific and should be retrieved using codeSpace. (e.g. PHR : PA, XS or PX).	MD_CoverageDescription/ MI_CoverageDescription/ MI_Sensor/ operationalMode	yes	0..1
sensor/ Sensor/ resolution	Sensor resolution.		no	0..1
sensor/ Sensor/ swathIdentifier	Swath identifier (e.g. Envisat ASAR has 7 distinct swaths (I1,I2,I3...I7) that correspond to precise incidence angles for		no	0..1

	the sensor). Value list can be retrieved with codeSpace.			
acquisitionParameters/Acquisition/orbitNumber	Acquisition orbit number		no	0..1
acquisitionParameters/Acquisition/lastOrbitNumber	Acquisition last orbit number		no	0..1
acquisitionParameters/Acquisition/orbitDirection	Acquisition orbit direction (Ascending or descending)	MD_ContentInformation/MD_CoverageDescription/MD_ImageDescription/platformDescending	no ( keep text rather than boolean, prefer alignment with other acquisition parameters)	0..1
acquisitionParameters/Acquisition/wrsLongitudeGrid	Neutral wrsLongitudeGrid to replace track in track/frame, K in K/J, etc.  The optional attribute "eop:codeSpace" is used to point the reference grid		no	0..1
acquisitionParameters/Acquisition/wrsLatitudeGrid	Neutral wrsLatitudeGrid to replace frame in track/frame, J in K/J, etc.  The optional attribute "eop:codeSpace" is used to point the reference grid		no	0..1
acquisitionParameters/Acquisition/ascendingNodeDate	UTC date and time at ascending node of orbit		no	0..1
acquisitionParameters/Acquisition/startTimeFromAscendingNode	Start time of acquisition in milliseconds from Ascending node date		no	0..1
acquisitionParameters/Acquisition/	Stop time of acquisition in		no	0..1

completionTimeFromAscendingNode	milliseconds from Ascending node date			
acquisitionParameters/Acquisition/ascendingNodeLongitude	Longitude at ascending node of orbit		no	0..1
acquisitionParameters/Acquisition/orbitDuration	Actual orbit duration in milliseconds		no	0..1
acquisitionParameters/Acquisition/acrossTrackIncidenceAngle	Acquisition across the track incidence angle given in degrees (i.e. uom='deg')	MD_ContentInformation/MD_CoverageDescription/MD_ImageDescription/relativeAzimuth	no	0..1
acquisitionParameters/Acquisition/alongTrackIncidenceAngle	Acquisition along the track incidence angle given in degrees (i.e. uom='deg')		no (consistency in EOP between two angle definitions)	0..1
acquisitionParameters/Acquisition/incidenceAngle	Acquisition global incidence angle given in degrees (i.e. uom='deg')		no (consistency in EOP between two angle definitions)	0..1
acquisitionParameters/Acquisition/pitch	Satellite pitch angle given in degrees (i.e. uom='deg')		no	0..1
acquisitionParameters/Acquisition/roll	Satellite roll angle given in degrees (i.e. uom='deg')		no	0..1
acquisitionParameters/Acquisition/yaw	Satellite yaw angle given in degrees (i.e. uom='deg')		no	0..1

**Table 5 : <eop:EarthObservationEquipment> fields description**

### 7.1.3 Footprint

The *eop:Footprint* block contains description of the target location observed during the *EarthObservation* (Figure 7).

**Figure 7 : <eop:Footprint> diagram**

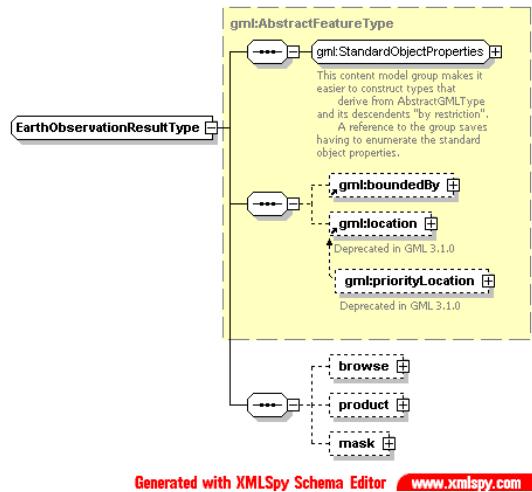

Complete description of `eop:Footprint` is given in Table 6.

Field name	Field description	ISO 19115-2 definition	ISO mapping	Cardinality
multiExtentOf	Acquisition footprint coordinates, described by a closed polygon (last point=first point), using CRS:WGS84, Latitude,Longitude pairs (per-WGS84 definition of point ordering, not necessarily per all WFS implementations). Multi polygons are allowed.		no	1
centerOf	Acquisition center coordinates	MD_CoverageDescription/ MI_CoverageDescription/ MD_ImageDescription/ MI_ImageDescription/ nadir	no	0..1

**Table 6 : <eop:Footprint> fields description**

#### 7.1.4 EarthObservationResult

The `eop:EarthObservationResult` block contains description of the result of the `EarthObservation` (Figure 8).

**Figure 8 : <eop:EarthObservationResult> diagram**

Complete description of *eop:Footprint* is given in Table 7.

Field name	Field description	ISO 19115-2 definition	ISO mapping	Cardinality
browse				0..1
Browse/BrowseInformation				1..n
browse/ BrowseInformation/ type	Browse type.  Possible values are : - THUMBNAIL - QUICKLOOK - ALBUM.	MD_Identification/ MD_BrowseGraphic  ?	no	1
browse/ BrowseInformation/ subType	Browse subType. Value is mission specific. Value list can be retrieved with codeSpace (e.g. For MODIS : OPTICAL, THERMAL)	MD_Identification/ MD_BrowseGraphic  ?	no	0..1
browse/ BrowseInformation/ referenceSystemIdentifier	Indicates if browse is geo-referenced, and thus can be assumed to be displayed directly on a map (in which case should point to a code space for the CRS), when not supplied it is assumed that the browse is provided in	MD_Identification/ MD_BrowseGraphic  ?	no	1

	"raw" satellite frame of reference			
browse/ BrowseInformation/ fileName	Path to the browse image (could be any kind of URL : direct link to the image or WMS/WCS interface), it is assumed that if a client is prepared to "manage" a browse delivered by e.g. WMS they would parse the URL to identify that it contains the OGC standard SERVICE=WMS	MD_Identification/ MD_BrowseGraphic/ fileName	yes	1
product				0..1
product/ProductInfor mation				1..n
product/ ProductInformation/ fileName	Path to the actual product data if available online (could be any kind of URL : direct link to the image or WMS/WCS interface), it is assumed that if a client is prepared to "manage" a product delivered by e.g. WCS they would parse the URL to identify that it contains the OGC standard SERVICE=WCS	MD_ServiceIdentification	no  (use filename definition as per browse)	0..1
product/ ProductInformation/ referenceSystemId entifier	Indicates if product is geo- referenced, (in which case should point to a code space for the CRS), when not supplied it is assumed that the browse is provided in "raw" satellite frame of reference	MD_DataIdentification/ MD_SpatialRepresentationT ypeCode  (propose adding a code for un-georeferenced) (The CRS is part the geometry. Including it here will create maintenance difficulties)	no	0..1
product/ ProductInformation/ version	Product version	MD_DataIdentification supplementalInformation	no	0..1
product/ ProductInformation/ size	Product size (bytes) allowing the user to realise how long a download is likely to take	MD_DataIdentification supplementalInformation	no	0..1
mask				0..1

mask/MaskInformation				1..n
mask/ MaskInformation/ type	Mask type. Possible values are : SNOW, CLOUD and QUALITY		no	1
mask/ MaskInformation/ format	Mask format. Possible values are : RASTER or VECTOR		no	1
mask/ MaskInformation/ referenceSystemIdentifier	Indicates if mask is geo-referenced, and thus can be assumed to be displayed directly on a map (in which case should point to a code space for the CRS), when not supplied it is assumed that the mask is provided in "raw" satellite frame of reference		no	0..1
mask/ MaskInformation/ fileName	Path to the mask (could be any kind of URL : direct link to the image or WMS/WCS interface in case of RASTER mask; direct link to the file or WFS interface in case of VECTOR file), it is assumed that if a client is prepared to "manage" a mask delivered by e.g. WMS they would parse the URL to identify that it contains the OGC standard SERVICE=WMS		no	1

**Table 7 : <eop:EarthObservationResult> fields description**

## 7.2 Thematic EO product data schema

The Thematic EO Product schemas provide the description of metadata common to thematic category of General EO Products derived. Thematic EO Products schemas extend the “eop” schema.

### 7.2.1 Optical EO Product data schema

The “opt” schema provides the description of metadata common to all EO Products derived from optical satellite based remote sensing. It describes the same fields as the “eop” schema plus optical specific fields.

As described in §6.3.2.1, the root element of the “opt” schema, named `<opt:EarthObservation>` simply extends the `<eop:EarthObservationType>` type (with no element added) :

```

<xs:element name="EarthObservation" type="opt:EarthObservationType"
substitutionGroup="eop:EarthObservation"/>

<xs:complexType name="EarthObservationType">
  <xs:complexContent>
    <xs:extension base="eop:EarthObservationType">
      <xs:sequence/>
    </xs:extension>
  </xs:complexContent>
</xs:complexType>

```

Two properties are extended from the eop schema :

- *opt:EarthObservationResults* extends *eop:EarthObservationResults* (Table 8);
- *opt:Acquisition* extends *eop:Acquisition* (Table 9).

<b>Field name</b>	<b>Field description</b>	<b>ISO 19115-2 definition</b>	<b>ISO mapping</b>	<b>Cardinality</b>
<code>eop:EarthObservationEquipment/</code> <code>eop:acquisitionParameters/</code> <code>opt:Acquisition/</code> <code>opt:illuminationAzimuthAngle</code>	Azimuth angle given in degrees (i.e. <code>uom='deg'</code> )	<code>MD_ContentInformation/</code> <code>MD_CoverageDescription/</code> <code>MD_ImageDescription/</code> <code>illuminationAzimuth</code>	yes	0..1
<code>eop:EarthObservationEquipment/</code> <code>eop:acquisitionParameters/</code> <code>opt:Acquisition/</code> <code>opt:illuminationElevationAngle</code>	Elevation angle given in degrees (i.e. <code>uom='deg'</code> )	<code>MD_ContentInformation/</code> <code>MD_CoverageDescription/</code> <code>MD_ImageDescription/</code> <code>illuminationElevation</code>	yes	0..1

**Table 8 : `<opt:Acquisition>` extension of `<eop:Acquisition>`**

<b>Field name</b>	<b>Field description</b>	<b>ISO 19115-2 definition</b>	<b>ISO</b>	<b>Cardinality</b>
-------------------	--------------------------	-------------------------------	------------	--------------------

			mapping	
opt:EarthObservationResult/ opt:cloudCoverPercentage	Cloud cover percentage (i.e. uom='%')	MD_ContentInformation/ MD_CoverageDescription/ MD_ImageDescription/ cloudCoverPercentage	yes	0..1
opt:EarthObservationResult/ opt:cloudCoverPercentageAssessmentPercentage	Cloud cover assessment confidence. Expressed in percents.		no	0..1
opt:EarthObservationResult/ opt:cloudCoverPercentageQuotatlonMode	Indicator to know how the cloud cover percentage has been calculated  Value : AUTOMATIC, MANUAL		no	0..1
opt:EarthObservationResult/ opt:snowCoverPercentage	Snow cover percentage (i.e. uom='%')		no	0..1
opt:EarthObservationResult/ opt:snowCoverPercentageAssessmentPercentage	Snow cover assessment confidence. Expressed in percents.		no	0..1
opt:EarthObservationResult/ opt:snowCoverPercentageQuotatlonMode	Indicator to know how the snow cover percentage has been calculated  Value : AUTOMATIC, MANUAL		no	0..1

**Table 9 : <opt:EarthObservationResult> extension of <eop:EarthObservationResult>**

### 7.2.2 Radar EO Product data schema

The “sar” schema provides the description of metadata common to all EO Products derived from radar satellite based remote sensing. It describes the same fields as the “eop” schema plus radar specific fields.

As described in §6.3.2.1, the root element of the “sar” schema, named `<sar:EarthObservation>` simply extends the `<eop:EarthObservationType>` type (with no element added) :

```

<xs:element name="EarthObservation" type="sar:EarthObservationType"
substitutionGroup="eop:EarthObservation"/>

<xs:complexType name="EarthObservationType">
<xs:complexContent>
<xs:extension base="eop:EarthObservationType">
<xs:sequence/>
</xs:extension>
</xs:complexContent>
</xs:complexType>

```

One property is extended from the eop schema :

- *sar:Acquisition* extends *eop:Acquisition* (Table 10).

Field name	Field description	ISO 19115-2 definition	ISO mapping	Cardinality
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:polarisationMode	single S, dual D, twin T, quad Q, UNDEFINED Valids : D, Q, S, T, UNDEFINED	MD_CoverageDescription/ MD_RangeDimension/ MD_Band/ MI_Band/ MI_PolarizationCharacteristics	no	1
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:polarisationChannels	polarisation channel transmit/receive configuration: horizontal, vertical. Valids: - HH - HV - VH - VV - HH, VV - HH, VH - HH, HV - VH, VV - VH, HV - VV, HV - HH, VV, HV, VH - UNDEFINED	MD_CoverageDescription/ MD_RangeDimension/ MD_Band/ MI_Band/ MI_PolarizationCharacteristics	no	1
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:antennaLookDirection	LEFT or RIGHT		no	1
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/	minimum incidence angle		no	1

sar:minimumIncidenceAngle				
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:maximumIncidenceAngle	maximum incidence angle		no	1
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:incidenceAngleVariation	Incidence angle variation		no	1
eop:EarthObservationEquipment/ eop:acquisitionParameters/ sar:Acquisition/ sar:dopplerFrequency	Doppler Frequency of acquisition		no	1

**Table 10 : <sar:Acquisition> extension of <eop:Acquisition>**

### 7.2.3 Atmospheric EO Product data schema

The “atm” schema provides the description of metadata common to all EO Products derived from atmospheric based remote sensing. It describes the same fields as the “eop” schema plus atmospheric specific fields.

As described in §6.3.2.1, the root element of the “atm” schema, named `<atm:EarthObservation>` simply extends the `<eop:EarthObservationType>` type (with no element added) :

```

<xs:element name="EarthObservation" type="atm:EarthObservationType"
            substitutionGroup="eop:EarthObservation"/>

<xs:complexType name="EarthObservationType">
    <xs:complexContent>
        <xs:extension base="eop:EarthObservationType">
            <xs:sequence/>
        </xs:extension>
    </xs:complexContent>
</xs:complexType>

```

One property is extended from the eop schema :

- *atm:EarthObservationResult* extends *eop:EarthObservationResult* (Table 11).

Field name	Field description	ISO 19115-2 definition	ISO mapping	Cardinality
atm:EarthObservationResult/ atm:dataLayers/	Specy contained in		no	1

atm:DataLayer/ atm:specy	dataLayer			
atm:EarthObservationResult/ atm:dataLayers/ atm:DataLayer/ atm:unit	Unit of specy in dataLayer		no	1
atm:EarthObservationResult/ atm:dataLayers/ atm:DataLayer/ atm:highestLocation	Top height of datalayer (in meters)	EX_VerticalExtent/ EE_VerticalExtentLocations/ highestLocation	yes	1
atm:EarthObservationResult/ atm:dataLayers/ atm:DataLayer/ atm:lowestLocation	Bottom height of datalayer (in meters)	EX_VerticalExtent/ EE_VerticalExtentLocations/ lowestLocation	yes	1
atm:EarthObservationResult/ atm:dataLayers/ atm:DataLayer/ atm:algorithmName	Name of algorithm used to compute datalayer		no	1
atm:EarthObservationResult/ atm:dataLayers/ atm:DataLayer/ atm:algorithmVersion	Algorithm version used to compute datalayer		no	1

**Table 11 : <atm:EarthObservationResult> extension of <eop:EarthObservationResult>**

#### 7.2.4 Mission specific schema : example for Pleiades HR data schema

The “phr” schema provides the description of Pleiades HR public metadata. It derived from optical EO product.

As described in §6.3.2.2, the root element of the “phr” schema, named `<phr:DataStrip>` simply extends the `<eop:EarthObservationType>` type (with no element added) with the addition of the `eop:type` attribute :

```

<xs:element name="DataStrip" type="phr:DataStripType"
substitutionGroup="opt:EarthObservation"/>

<xs:complexType name="DataStripType">
  <xs:complexContent>
    <xs:extension base="opt:EarthObservationType">
      <xs:sequence>
        <xs:attribute ref="eop:type" use="required"/>
      </xs:sequence>
    </xs:extension>
  </xs:complexContent>
</xs:complexType>

```

PHR taxonomy, and mission specific taxonomy in general, is out of the scope of this document and is not described in this document.

### 7.3 Issues

GML is a complex standard that is richly expressive. The Earth Observation Products does not exploit the entire standard but employ a subset of constructs corresponding to its relevant requirements.

As a consequence, the Earth Observation application schema used a GML subset instead of the complete GML definition (see Annex E). The use of this GML subset is recommended to simplify the development of computer application dealing with Earth Observation Product schemas (client-side or server-side applications).

### 7.4 XML schema documents

The different GML application schemas are specified in the normative XML Schema Documents included in the zip file with this text document, which are named:

- a) eop.xsd
- b) atm.xsd
- c) opt.xsd
- d) sar.xsd
- e) phr\_datastrip.xsd
- f) phr\_scene.xsd

All these XML Schema Documents contain documentation of the meaning of each element and attribute, and this documentation shall be considered normative as specified in Subclause 11.6.3 of [OGC 05-008].

These XML Schema Documents are bundled in a zip file with this document. After OGC acceptance of a Version 1.0.0 of this Best Practice, these XML Schema Documents will also be posted online at the URL <http://schemas.opengis.net>. In the event of a discrepancy between the bundled and online versions of the XML Schema Documents, the online files shall be considered authoritative.

**Annex A**  
(normative)

**Abstract test suite**

An abstract test suite is not provided in this version of this standard.

## Annex B (normative)

### Examples using “eop” application schema

#### B.1 Introduction

This annex contains several example XML documents encoded using the “eop” application schema.

#### B.2 Example of “eop” EO Product

<!-- ===== -->
<complexType name="AssociationType">
    <annotation>
        <documentation>A pattern or base for derived types used to specify complex types corresponding to an unspecified UML association - either composition or aggregation. Restricts the cardinality of Objects contained in the association to a maximum of one. An instance of this type can contain an element representing an Object, or serve as a pointer to a remote Object.</documentation>
    </annotation>

```

Descendents of this type can be restricted in an application schema to

- \* allow only specified classes as valid participants in the aggregation
- \* allow only association by reference (i.e. empty the content model) or by value (i.e. remove the xlink).

When used for association by reference, the value of the gml:remoteSchema attribute can be used to locate a schema fragment that constrains the target instance.

In many cases it is desirable to impose the constraint prohibiting the occurrence of both reference and value in the same instance, as that would be ambiguous. This is accomplished by adding a directive in the annotation element of the element declaration. This directive can be in the form of normative prose, or can use a Schematron pattern to automatically constrain co-occurrence - see the declaration for \_strictAssociation below.

If co-occurrence is not prohibited, then both a link and content may be present. If this occurs in an instance, then the rule for interpretation is that the instance found by traversing the href provides the normative value of the property, and should be used when possible. The value(s) included as content may be used if the remote instance cannot be resolved. This may be considered to be a "cached" version of the value(s).</documentation>
